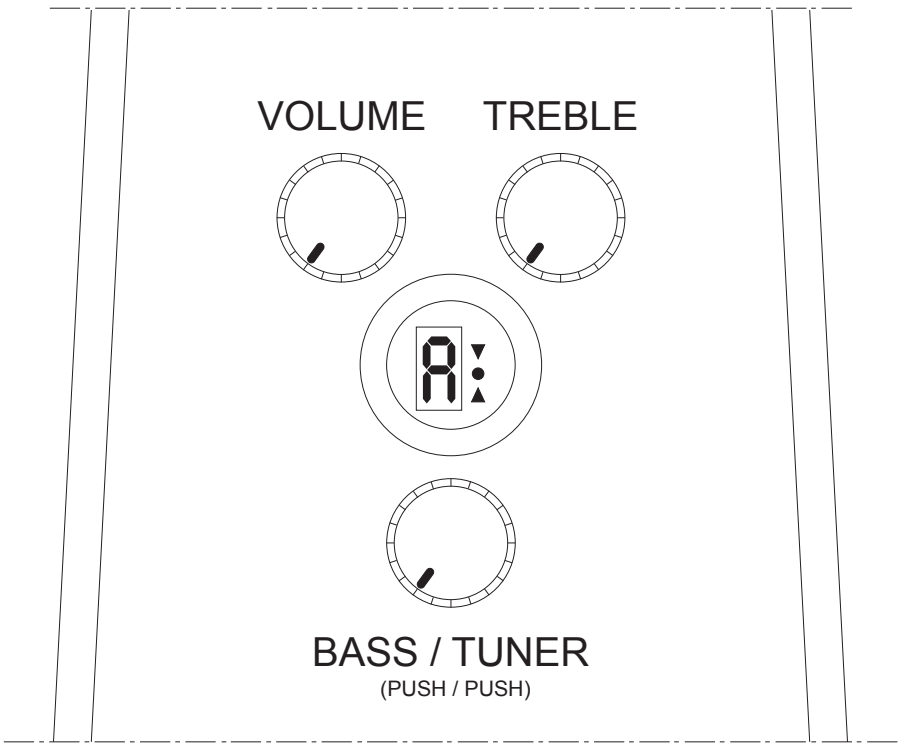
Mayson MPC-6 pickup system

Thank you for choosing this Mayson guitar. Your guitar is equipped with the Mayson proprietary pickup system. This system will provide a natural amplified sound. The built-in pre amplifier lets you control the volume and tone of the electric signal, plus you have the advantage of a built-in tuner.

Left button: Volume control.

Right button: High frequency control

Middle button: Tuner and active bass control.

Push the button to activate the tuner. The tuner responds best when the string is played very evenly, or when a 12th fret harmonic is played. When the tuner is activated, the guitar signal is muted.


Active bass control. In the middle position of the control, you can feel a click. On the left of this click the control acts as a regular, passive bass control. Turned to the right of the neutral position, you will actively add low frequencies. Please use this control judiciously, adding too much low frequencies will result in feedback.
